

Distance between the topics extracted from the pre interview and those extracted from the post interview (topics fitted separately per timepoint)

Within: how far are the post topics from the pre topics?
 diamond = observed; grey bar = up to the 95th percentile expected by chance, tick = chance mean
 (chance: pre/post labels swapped within participants, topics refitted 1000 times)

Between: do the conditions differ in how far their topics move?
 dot = observed difference; grey bar = 95% of differences when condition labels are shuffled across participants (topics fixed)
